2017 BICSI Winter Conference & Exhibition
January 22-26 • Tampa, FL
Brought to you by the Association for Passive Optical LAN (APOLAN)

Founding Members:

www.apolanglobal.org
Course Agenda

• Day 1
  – Passive Optical LAN: 101 – Sean Kelly, RCDD
  – Introduction to POL Components – Matt Miller
  – Introduction to POL Design with Hands-On – Mike Watts, ITS

• Day 2
  – Day 1 Review
  – Power Survivability – Dustin Bateman
  – POL Testing Considerations – Sean Kelly, RCDD
  – POL Integration and Management – Matt Miller
  – POL Project Closeout Package Deliverables – Mike Watts, ITS
I am a...

A. Consultant
B. Designer
C. Contractor
D. Manufacturer
E. End User
F. Other
My experience with POL is...

A. I have installed one
B. I have turned one up
C. I have a project now
D. I have some knowledge
E. I am here to learn
Passive Optical LAN: 101

Sean Kelly, RCDD
Application Engineer, CommScope

2017 BICSI Winter Conference & Exhibition
January 22-26 • Tampa, FL
Section 1 Agenda

- Introduction to Passive Optical LAN
- Where did it originate
- Market adoption
- Knowledge Check
Costs 40 to 60% more!!
Consumes twice the power!!
Promotes inefficient use of bandwidth!!
Costs 40 to 60% more!!

A Local Area Network that...

This describes a traditional LAN!
Passive Optical LAN

The infrastructure of tomorrow available today

“A Bandwidth Efficient LAN Architecture Providing Measurable CapEx & OpEx Savings”
Thoughts...

Henry Ford Wisdom…
“If I’d asked customers what they wanted, they would have said “a faster horse.”

Steve Jobs Wisdom…
“Man is the creator of change in this world. As such he should be above systems and structures, and not subordinate to them.”

“There aren’t many horse and buggies on the road and most of us don’t have typewriters sitting on our desks. So why are copper networks still so widely used although they have been rendered obsolete by next-generation technologies?” Scott Forbes, CEO Forbes Media
Key Acronyms

- GPON
- PON vs. POL
- OLT and ONT
What is Passive Optical LAN?

- Revolutionary
- Economical
- Efficient
What is Passive Optical LAN?

Fiber Based Local Area Network

Point to Multipoint Topology

Standards based/recognized technology

ITU G984.x

ANSI/TIA 568C

BICSI TDMM 13
Why Passive Optical LAN?

- **Reduced Costs**
  - CapEx: ~40-60% One Time
  - OpEx: ~50-75% Every Year
  - Construction: Cable Tray, Conduit, and Pathways
    - Sleeving, Coring, and Fire Stopping

- **Technically Future Proof**
  - Singlemode: Unknown Bandwidth Capacity
  - Migration: Only upgrade users that need it

- **Scale and Reach**
  - Easy MACs: Can save 8-10 minutes per MAC
  - 20km/12.5mi: No 300m / 90+10m limitations

- **Construction Reduced Costs**
  - ~40-60% CapEx
  - ~50-75% OpEx
  - ~50-75% Construction

- **Future Proof**
  - Technically: Future
  - Economically: Future

- **Future Ready**
  - CapEx: ~40-60% One Time
  - OpEx: ~50-75% Every Year
  - Construction: Cable Tray, Conduit, and Pathways
    - Sleeving, Coring, and Fire Stopping

- **Easy MACs**
  - Can save 8-10 minutes per MAC
  - No 300m / 90+10m limitations
Why Passive Optical LAN?

**Security**
- AES 128 Encryption in the downstream
- No crosstalk concerns with fiber
- No EMI/RFI or Tempest Shielding

**Green IT**
- **Power**
  - Switches, UPS, HVAC
- **Floor Space**
  - Reduce or eliminate TRs
- **Building Weight**
  - Cable, Trays, Racks, CRACs, etc.
- **Waste**
  - Less site waste and use of NRMs
- **Fire Load**
  - Reduced cable mass and fire stop
- **LEED/STEP**
  - Potential Credits
Why Passive Optical LAN?

- **Carrier Grade Electronics**: POL electronic components are designed and manufactured to have a service life greater than 25 years as required by carriers, compared to 5-8 years with Enterprise grade equipment.

- **High Availability**:
  - Five 9s (99.999) with POL vs. Three 9s (99.9) with switches
  - Nearly six 9s (99.9999) of availability with POL using FSAN-B Redundancy

  - Five 9s = 5.26 min/yr
  - Three 9s = 8.76 hr/yr
What should you know?

**Similar**
- Standards Based
- Local Area Network
- Enterprise Management
- Ethernet Frame Transport
- 802.1x – 802.1Q – PoE

**Different**
- Point to Multipoint
- Multiple Services
- Guaranteed Bandwidth
- Single Strand of SM Fiber
- No Access and Distribution
Where did it come from?

Single Dwelling
- Voice
- Video
- Data

MDU
- Fiber Hubs and Terminals
- Minimal Pathway Required
- No Power, Cooling or BBU
- No TR/IDFs Required

Carrier FTTH
- No TR/IDF
- No Power
- No Cooling
- No BBU
- No Horizontal Pathway

Copper Cabling
- No Riser Pathway
- No Horizontal Pathway
- Fiber Hubs and Terminals
- Minimal Pathway Required
- No Power, Cooling or BBU
- No TR/IDFs Required

- Dallas Fort Worth Airport
- Trump Tower Miami
- Trump Plaza NY
- Stuyvesant Town/Peter Cooper Village NY

Financial
- Russell Investments (AU)
- SouthEast Bank
Example POL Implementation

*Global Fortune® 225 Company – Americas Headquarters Melville, NY USA*

**Project Overview:**
- Approximately 1 million sq. ft. (main building and 2 parking garages)
  - Planned growth for another 200,000 sq. ft.
- 1,500 employees
  - Planned growth for another 750
- Nearly 12,000 GPON Ethernet ports

**Integrated Technologies over GPON:**
- VoIP (PCs tethered through phone)
- Security
  - Access Control
  - Biometrics
  - Cameras (main building and parking)
  - Virtual turnstiles
  - Blue Phones in parking garage
- 480 WAPs
- Building automation
- Environmental controls
- IP Video content distribution
- Digital signage
- Point of Sale

**Project Highlights**
- $1 million in CAPEX savings
- Approximately $250,000/yr in energy savings
San Diego Downtown Central Library

Optical LAN

- Wireless Access Points
- Across library & courtyard
- Free access for patrons

- Rack Mount ONT
  - 24-ports GbE Ethernet
  - Mainly serving WAPs

- Chassis Style OLT
  - Located 4th floor data room
  - Serves all ONTs with 18 miles

- Surface Mount ONTs
  - 4-ports GbE Ethernet
  - Mainly mounted under desks

- Single Mode Fiber
- Passive Optical Splitters
- With Fiber Management

San Diego Downtown Central Library ~ modern smart and green building

- 9-story
- 3-story domed reading room
- 350-seat auditorium
- Technology center
- Outdoor plaza and café
- Coffee Bar
- LAN services Voice over IP, data & on-line video access
- Wi-Fi throughout the library and courtyard via 36 Meraki WAPs
- 3-D Printer Connectivity
- Nearly three hundred digital devices available
  - Workstations
  - iPads
  - iPad Minis
  - Chromebooks
  - Kindle
  - Sony eReaders
- Technology enable collaborative workspaces
- LEED Silver status

- 3-D Printer Connectivity
- Nearly three hundred digital devices available
  - Workstations
  - iPads
  - iPad Minis
  - Chromebooks
  - Kindle
  - Sony eReaders
- Technology enable collaborative workspaces
- LEED Silver status
Knowledge Check
Passive Optical LAN is a standards based/recognized technology

A. True
B. False
Guaranteed bandwidth is possible with...

✓ A. Passive Optical LAN
B. Switch Based
C. Both A and B
POL supports 802.1Q VLANs

A. True
B. False
AES 128 Encryption is present in __________ direction(s)

A. The upstream

B. The downstream

C. Both upstream and downstream

B. The downstream
Section 2 Agenda

• Verticals
• Bandwidth Requirements
• Dynamic Bandwidth Allocation
• Knowledge Check
Education Vertical

- **K-12**
  - Tight budgets vs. increased demand
  - Space constraints and non-traditional TRs/IDFs
  - Aging architecture vs. modern technology
    - Mondo Pads
    - AMX SchoolView
    - Smart Boards
    - Central content

- **Post Secondary / Higher Education**
  - Higher bandwidth demand
  - Increased BYOD
  - Valuable space lost with traditional
  - Lost revenue and added costs
    - Inefficient use of bandwidth
    - Inefficient use of space
    - Service providers profit
Hospitality Vertical

- **Hotels**
  - Industry groups driving POL advanced technology
    - HTNG – Hotel Technology Next Generation
    - HFTP – Hospitality Financial & Technology Professionals
      - HITEC – Hospitality Industry Technology Exposition and Conference
  - Higher port density in guest rooms and non administrative areas
    - Digital signage
    - Cameras
    - WAPs
    - IP card readers and locks
    - Four to eight data ports per guest room
  - Scalable solution with extended reach
    - Resort properties
    - Shared plot properties (Fairfield Inn, Courtyard, and Residence Inn)
  - Future proof cabling infrastructure
Healthcare Vertical

- **Assisted Living**
  - Patient wandering – WAP monitoring
    - In residence
    - Anywhere on the property
  - VoIP and Data needs in residence and administration
  - Security and Digital Communication

- **Critical Care**
  - Higher bandwidth demand
  - Higher port counts in patient rooms, nurse stations, and operating rooms
  - Building Automation and Intelligent Structures (converged networks)
    - Security
    - Monitoring
    - HVAC
    - Automated check-in / check out
    - Door sensors
    - No EMI/RFI concerns or Tempest shielding needed with fiber
    - Encrypted data pathways
Large Enterprise / Financial Verticals

• Large Office Building
  • Movement toward all BYOD
  • Converged networks (HVAC, Automation, Security, etc.)
  • Pathway and space constraints
  • Cost of traditional switch, cabling, and maintenance refresh
  • Increased technology
    • Pervasive wireless
    • Digital signage
    • Everything headed IP

• Financial (Banks and Trading Floors)
  • Higher bandwidth demand
  • Increased security
  • Increased port count
  • Redundancy, diversity, and automatic failover (FSAN-B)
  • Lost revenue and additional costs
    • Downtime (three 9s vs. five 9s)
    • Missed trades
    • Excess energy
Call Centers, Cities, and Retail

• **Call Centers**
  • High density areas
  • Low bandwidth requirements
    • IP Phones ~ 95Kb/s
    • Virtual “Dumb” terminals ~ 1Mb/s
    • Print/Scan/Fax ~ 500Kb/s

• **Cities, Towns, Neighborhoods, and MDUs**
  • Connect multiple buildings without distance limitations
  • Older buildings do not have pathways and spaces for traditional upgrades
  • Scalable solution for future expansion

• **Retail**
  • Digital signage
  • Customer Interactive Experience (pricing, web details, ordering, price compare)
  • Security, POS, multi-tenant service
You need how many “Gigs”?  

### Common LAN Services

Gartner 2013 Estimates of Bandwidth needs through 2017 shows Super Users with a maximum requirement of sub-7Mbps
How much bandwidth is really needed?

Optical LAN bandwidth compared to Peak bandwidth per User in 2017

- Blue represents symmetrical 1 gigabit bandwidth available at every ONT port
- Light Blue and Green represents Gartner Low User and High User bandwidth required 2017
Bandwidth Capacity vs. Bandwidth Traffic

Hey!!! Come check out my new 1200W stereo system. I have four 300W speakers in this thing.

Hang on there, Hoss! That there is a 35W amp. You have 1200W of capacity, but only a 35W system.
In traditional networks...

Listen up!!! I have 10Gig OM4 Fiber in my Backbone and 10Gig CAT6A Copper in my Horizontal, so when I put in a Gig switch it won't have any resistance and I will get a Gig to the desk and be future proof.
It is not a matter of resistance...

Does your IP phone need 208Mb/s?
Switch Data vs. Dynamic Bandwidth Allocation

24 Port 10/100 Ethernet Switch

Every data port has a 100Mb/s Connection
- A minimum of 100Mb/s
- A maximum of 100Mb/s

Let’s assume that half of the people are away from the desk
Every data port still has a 100Mb/s Connection
- A minimum of 100Mb/s

Most users use 0Mb/s over 98% of the workday
Every data port still has a 100Mb/s Connection
- A minimum of 100Mb/s
- A maximum of 100Mb/s

When all others are using 0Mb/s or are out of the office and a single user has to download a large file, they still have 100Mb/s.
- A minimum of 100Mb/s
- A maximum of 100Mb/s
Every user has a "Committed" 100Mb/s connection and an assigned "Burst" rate, in this case 1Gb/s.

- A minimum of 100Mb/s
- A maximum of 1Gb/s

Let's assume that half of the people are away from the desk. Every occupied data port still has a committed 100Mb/s connection, while the committed rates from the unoccupied desks are free to be shared. This is "Bursting."

Most users use 0 Mb/s over 98% of the workday.

When all others are using 0Mb/s, or are out of the office, and a single user has to download a large file, they are able to burst to 1Gb/s.

ASSUMPTIONS
- 1 ONT per person
- 24 ONTs per splitter
- 100 MB/s to each ONT

When a user or users return to their desk or start a task that requires bandwidth, their "Committed" data rate is theirs immediately regardless of if someone else was using it in a burst.

Switch Data vs. Dynamic Bandwidth Allocation
VLANS and Committed /Burst Rates
Gigabit switches provide 1Gb/s connections to each WAO

A. True

✓ B. False
Most users consume bandwidth all day long

A. True

✔️ B. False
This technology uses Dynamic Bandwidth Allocation

A. Switch Based

✓ B. Passive Optical LAN
Most users require a sustained GbE connection

A. True

✓ B. False

Traditional LAN vs. POL (GPON)
On a Campus

Optical LAN
Basic POL Schematic

- 1490nm Downstream (TDM) – Voice, Data, Switched Video
- 1310nm Upstream (TDMA) – Voice, Data, Signaling Video
- 1550nm Downstream ONLY – RF Video

Only upgrade the users that need 10G PON

* Methods vary by electronics vendor
The cabling infrastructure stays the same and only the users that need it are upgraded.
The Primary Components

**Optical Line Terminal (OLT)**

- Active equipment provided by suppliers such as Tellabs and Zhone
- -48VDC Carrier Grade Chassis
- After Layer 3
- Up to 14 Line cards
- Typically 4 singlemode output ports per card
  - = 56 Outputs per chassis
  - = 1792 Work Group Terminals (1x32 splitters)
  - = 7168 Ethernet Ports (ONT has 4 copper output ports)
The Primary Components

**Optical Splitters**

<table>

**Mini Plug-and Play Splitter**

**LGX Universal Splitter**

**1U Splitter Drawer**
(Holds 4 Mini P-N-P Splitters)

**Universal Splitter**

**Traditional 1U Rack-Mount Splitter**
Planar Light Circuit/Planar Waveguide
ONT – Optical Network Terminal

- Active equipment provided by suppliers such as Tellabs and Zhone.
- Located near the user or device
- Typically 4 RJ45 (10/100/1000) outputs with optional POE
- Up to 60W of available POE (vendor specific)
- Standard HVAC is adequate
- Optional internal or external battery back-up
- POTS and COAX ports available
- Establishes and maintains secure AES 128 Encryption
- Supports multiple VLANs on each port

The Primary Components
ONT Placement

- Ceiling tile mount
- Wall-mount
- Under-desk mount
- Desktop mount
- SECURE Wall Box
- Wall Plate ONT
ONT Sharing

128 Users = 4 SFP PON ports

128 Users = 2 SFP PON ports

128 Users = 1 SFP PON ports

= 32 Users/Splitter

= 64 Users/Splitter

= 128 Users/Splitter
Distance and Loss

OLT Output = +3dBm

Minimum of 15.5dB loss required!

ONT Range = -12.5dBm to -26dBm

ON 1x32 Passive Equipment (Splitter)

12.5mi / 20km

Up to 100m (Solid Conductor Cable)

Cat6

Each ONT may require an Attenuator
Type B (FSAN-B) Redundancy

If any interruption is detected on the primary path (OLT to ONT), the OLT will switch to the redundant path instantaneously.

OLT chassis is “Carrier Grade” meaning that it is designed to be in service for 25+ years with 100 possible.

Type B Redundancy = Nearly Six 9s
Example Layout of Type B (FSAN-B) Redundancy

- **Equipment Room**: Layer 3 Device

- **IDF Area**
  - **TR 1**
    - (Does not have to be a TR or IDF)
    - Path 1 (Primary)
    - RDT (6’x9’)
      - Includes 12F MPO on a spool
      - Each RDT serves up to 2 FSB32 devices (384 ONTs)
  - **TR 2**
    - (Does not have to be a TR or IDF)
    - Path 2 (Redundant)
    - RDT (6’x9’)
      - Includes 12F MPO on a spool
      - Each RDT serves up to 12 FSB32 devices (384 ONTs)

- **Office Area**
  - Path 1 (Primary)
  - CAT5 Patch Cord
  - ONT (up to 12/18/36 ports with VID)
  - SC/APC to SC APC
  - Wall Plate
  - FSB32 (9’x14’x5.5’)
    - Serves up to 32 ONTs
  - 2x32 Splitter
  - ZONE

*If Path 1 is interrupted, Path 2 activates (typically <200ms)*
**IP/Ethernet Protocol Support**

**Price per kw hour**: $0.082

**W/HR**:
- **Total POL Budget**: $14,050
- **Total Traditional Budget**: $37,171

**Difference**: $(23,121) $(16,589)

**Total Savings Percentage**: -62.20%
Potential* LEED Credits

- Energy and Atmosphere Credit 1 (1-3 pts).
  - Reduction in TRs, HVAC equipment, switch equipment, UPS, lighting and other energy needs.
  - The PON system helps the overall efficiency of the energy systems.

- Innovation in Design Credit 1 (1-4 pts).
  - The PON system utilizes less equipment, resulting in less raw materials, less garbage, less transportation and reduced time for implementation and commissioning.

- In addition, utilizing a fiber system ensures the life of the system extends beyond the life of a conventional “switched” system.

*not guaranteed or implied
“Eco-Friendly”

- **Reduced Power Requirements**
  - Savings between 40% to 60%
- **Reduced HVAC Requirement**
  - A Fortune 500 company saved about $450K on the Power distribution network (HVAC, backup etc) for a building project with 2000 Ethernet ports
- **Reduction in Non-renewable materials**
  - Reduction of up to 8000 pounds of plastic and copper versus a Cat 6 install for building of 4000 Ethernet ports
- **Floor Space Savings**
  - Traditional layer-2 solutions are bound by the 300ft Ethernet limitation
- **Fire Load Savings**
  - Savings in Sprinkler Systems
  - Fire Load and ceiling space savings

**Green Benefits**
- Reduction in power consumption
- Reduction in non-renewable materials
- Ceiling space and fire load savings
- Reduction in cabling costs
- Floor space savings

Introduction to POL Components

Matt Miller
Sr. Solutions Architect, CallisonRTKL

2017 BICSI Winter Conference & Exhibition
January 22-26 • Tampa, FL
Agenda

- Components
  - OLT
  - ONT
  - Video
  - DC Power
- Power Considerations
- Management
  - Centralized Management
  - Management Systems
  - Bandwidth Management
  - VLANs, QoS, LLDP and other Standards
Objectives

• Identify the various types of optical splitters and their principles of operation
• Identify the active electronic components in a Passive Optical LAN
• Understand the management principles for a POL
Components - OLT

- OLT is head-end component
- Typically located in MDF or Data Center
- Manages connected ONTs
- Typically consist of:
  - Management
  - Switch Fabric
  - Uplink Interfaces
  - PON Interfaces
- Out-of-band Management
Components – Large OLT Models

- Chassis-Based
- Fully Redundant
- Up to 224 PON Ports
- Thousands of ONTs
- DC Powered
Components – Small OLT Models

Small OLTs

• AC and DC Power
• Small Chassis and Standalone
• Small Office/Field Office
• 4 to 16 PON Ports
• Hundreds of ONTs
Components – OLT Uplinks

• Standard Ethernet uplinks to core
• Uplinks typically 1G or 10G pluggable optics
• VLANs trunked into uplink ports
• Uplinks can be combined into LAGs
Components – OLT PON Ports

- From 4 to 224 PON ports per OLT
- Each PON port typically supports 32 ONTs
  = Thousands of ONTs per OLT!
- Typically SFP based
- Class C+ optics feature 32dB loss budget
Components – OLT Redundancy

Typically Redundant
- Power
- Backplane
- Management
- Switch fabric
- Uplinks

Sometimes Redundant
- PON Ports
- PON Cards
- Entire OLT
Optical Splitters

- Splitters provide optical connections in pairs
- Each 1x2 split equates to ½ of the optical power
  - ~3dB loss
- Splitters range from 1x2 up to 1x64 splitters
- 1x32 is the most common split ratio for POL
Optical Splitter

The term "passive" in Passive Optical Network refers to the fact that the splitter requires no power as opposed to an "active" device like the OLT or switches in a traditional network. The splitter serves to optically replicate upstream signals to a number of downstream fibers. The typical number of fibers served in a PON network is 32. As the splitter provides a replicated optical signal to all 32 subscribers downstream, it is simultaneously combining those 32 fibers into a single feeder fiber in the upstream direction. Consequently, the optical splitter is sometimes referred to as a splitter/combiner. The splitter will be housed in a number of form factors.
PLC Splitter

Planar Lightwave Circuit (PLC) Splitter

• More Expensive
• Uniform Output
• Most appropriate for outdoor use
• Manufacturing
  1. Waveguide used to split the optical signal is fabricated using a silicon dioxide chip.
  2. Involves a lithographic process similar to that used in the manufacture of silicon computer chips. PLC splitters provide the most uniformity between fiber outputs (the downstream fibers) with respect to the amount of optical loss measured on each fiber.
• Best choice when loss is critical
FBT Splitter

Fused Biconical Taper (FBT) splitter

• Lower Cost
• Typically less uniform from fiber to fiber.
• Manufacturing
  1. Thermally fused two overlapping fibers together under tension
  2. The resulting fusion splice creates a two by two splitter.
  3. Typically, one of these fiber connections is trimmed off and the result is a single fiber subtending to two fibers.
  4. These two fiber outputs can then be fused to additional one-by-two splitters until the desired number of splits is achieved.
• Used where extreme temperature variations or other environmental factors are not likely to cause the optics connected at the ends of the fiber to drift from their optimum wavelength specifications.
2xN Splitters

- 2 Inputs
- 2 to 64 Outputs
- Second Input Allows
  - Redundant feeders/PON Ports/PON Cards/OLTs
  - Easier Migration to 10G
  - Flexibility for the Future
ONTs

- ONT located close to the end user
- Fiber input
- Variety of user interfaces available
- Provide PoE
- Consume ~7W power + PoE draw
ONT Models

- Large variety of ONTs available
- AC and DC power options
- Desk-mount, In-wall, and Rack-mount
- Battery backup

- Match interfaces to user needs:
  - Ethernet Ports with PoE
  - POTS Ports
  - Coaxial Television
  - Wi-Fi
ONT Connections

What Can I Connect?

- PCs
- Thin Clients
- VoIP Phones
- POTS Phones
- Wireless Access Points
- Coaxial Cable TV
- IPTV

- Access Control
- Security Cameras
- Building Management Systems
- Biometric Sensors
- Anything with an Ethernet, POTS, or Coax Interface!
ONT Compatibility

• EPON and GPON are not compatible
• Different manufactures *typically* choose not to interoperate
• Beyond the standards, some manufacturers implement additional features – especially true in EPON
ONT Security

• ONT security designed to assume the ONT is in the hands of the adversary
• ONT does not function without OLT
• Usually no management ports on ONT
• ONT receives all programming from OLT
Power Considerations

- ONTs report a loss of power or loss of service
- ONTs can be powered via AC or DC
- Battery backups for high availability
- PoE and PoE+ available
Components - Video

- Laser Transmitter – Electrical to Optical 1550nm Conversion
- EDFA (Erbium Doped Fiber Amplifier) – Amplifies Optical Signal to 18 – 21dBm
- WDM – Combines Wavelengths
Components - Video

- Laser Transmitter
- EDFA
- RF Nodes
- RFoG/two-way
Components – DC Power

- Most OLTs use -48V DC Power
- Same power used in telco central offices
- Rectifiers required to convert AC to DC
- Properly ground your equipment!

2017 BICSI Winter Conference & Exhibition
January 22-26 • Tampa, FL
Components – DC Power

- Redundant Inputs
- Redundant Outputs
- Redundant Rectifiers
- Fuse or Circuit Breaker Protection
- Network Management
- Basically an external power supply!
Centralized Management

• ONTs Centrally Managed
• No physical ONT management ports
• Same concepts as traditional network
  – VLANs
  – PoE
  – QoS
Centralized Management
Management Systems

- Systems included standard CLI and EMS
- OLT runs without management server
- Application and Web/Mobile
- GUI is more important in PON than legacy networks
  - Density is far greater!
- ONTs are an extension of the OLT
Profiles & Templates

• Create a standard profile or template for your services

• Apply that profile or template to many ONTs at once!
Management Systems Features

- Alarming and Notification
- Bandwidth Monitoring
- Central OLT & ONT Upgrades
- MAC Searches
- VLAN Member Reports
Bandwidth Management

• Bandwidth Management is Built-in!
• Guarantee every user bandwidth
  – Set a committed rate
  – Committed rates cannot exceed capacity of any link in the system
• Manage additional bandwidth as you desire
  – Set a peak rate
Managing All The Same Things

The same things you manage today...

- VLANs
- PoE
- QoS
- LLDP
- Network Access Control
PON to POL

- Passive Optical LAN is the application of PON in a LAN environment
- OSP gear replaced with LAN gear
- Same great qualities for MSOs applies to Enterprise
- First adopted by U.S. Government with fiber to the desk requirements
What makes PON a POL?

1. Indoor ONTs
2. Power over Ethernet
3. Internal Packet Switching
4. Enterprise Ethernet Features
Questions?

Introduction to POL Components

Matt Miller
Sr. Solutions Architect, CallisonRTKL
Introduction to POL Design

Mike T. Watts, ITS
Vice President, Noovis

2017 BICSI Winter Conference & Exhibition
January 22-26 • Tampa, FL
Section 9 Agenda

• POL Component and Budget Review
• POL Cable Design Options Overview
• Design Challenge Exercise
• Knowledge Check
APC and UPC

- Ultra Physical Contact Connectors (UPC)
  - Blue

- Angled Physical Connectors (APC)
  - Green
Splitter Deployment

Single Splitter
- One splitter in the Optical Distribution Network
- All splitter loss is at one location
- Works for 99% of POL deployments
Splitter Deployment

Cascaded Splits
- Used when end users are geographically dispersed
- Campus out-buildings
- Loss from splitters in path must be summed

Engineered Splits
- Loss may favor a particular output
Centralized Split Overview

FDH
Houses Splitters

Consolidation Point
Zone Cabling
Centralized Splitting

• Provides maximum ROI for POL
• Houses splitters in one location per floor
• Installation Labor hours are reduced
• Connection between Riser and Horizontal

Hybrid Deployments

- Some deployments choosing hybrid deployments
- Hybrid Ideas
  - Keep IDF for rack-mount ONTs, but use fiber zone hubs
  - Put ONTs in active zone box and run category cabling to user
  - Use 100% rack-mount ONTs in retrofit scenario
Campus Overview
OSP Deployment

• OSP options can be mixed with LAN options
• Be careful of mixing manufacturer product lines due to incompatibility issues
• Many options due to PON history in telecommunications
Good Design Practices

✓ Meets customer requirements
✓ Provides a value to the customer:
  ✓ Reduced Cost
  ✓ Power/Space/Cooling
  ✓ Performance
  ✓ Longevity
✓ Is not overly complex
✓ Makes customer happy!

Passive Optical LAN is a standards based/recognized technology

A. True
B. False
Guaranteed bandwidth is possible with...

A. Passive Optical LAN
B. Switch Based
C. Both A and B
POL supports 802.1Q VLANs

A. True
B. False

```plaintext
Similar
- Standards Based
- Local Area Network
- Enterprise Management
- Ethernet Frame Transport

Different
- Point to Multipoint
- Multiple Services
- Guaranteed Bandwidth
- Single Strand of SM Fiber
- No Access and Distribution
```

802.1x – 802.1Q – PoE
AES 128 Encryption is present in _______ direction(s)

A. The upstream
B. The downstream
c. Both upstream and downstream
Gigabit switches provide 1Gb/s connections to every WAO

A. True

✓ B. False
Most users consume bandwidth all day long

A. True

B. False

Most users use 0 Mb/s over 98% of the workday
This technology uses Dynamic Bandwidth Allocation

A. Switch Based
B. Passive Optical LAN
Most users require a sustained GbE connection

A. True

B. False

[Image: Table showing typical required bandwidth for various services]

[Image: Graph showing committed information rate]
Upstream (ONT to OLT) analog video utilizes which wavelength?

A. 1550nm
B. 1490nm
C. 1310nm
D. 1625nm
E. None

Answer: E. None
A cascaded $1 \times 4 + 1 \times 16$ split is a good practice?

A. True

B. False
GPON bandwidth can be increased by using a lower split ratio

A. True

B. False
The minimum loss required between the OLT and ONT is...

A. 13.5dB
B. 10.7dB
C. 15.5dB  ✔
D. 17.2dB
E. None of these
PoE in a POL is administered at the...

A. OLT

B. ONT

C. Injector

D. PoE is not possible

**ONT – Optical Network Terminal**

- Active equipment provided by suppliers such as Tellabs and Zhone.
- Located near the user or device
- Typically 4 RJ45 (10/100/1000) outputs with optional POE
- Up to 60W of available POE (vendor specific)
- Standard HVAC is adequate
- Optional internal or external battery back-up
- POTS and COAX ports available
- Establishes and maintains secure AES 128 Encryption
- Supports multiple VLANs on each port
Which of these are a benefit of POL?

A. Reduction in power
B. Reduction of fire load
C. Reduction of non-renewable materials
D. All of these are benefits
LEED Credits are

- Energy and Atmosphere Credit 1 (1-3 pts).
  - Reduction in TRs, HVAC equipment, switch equipment, UPS, lighting and other energy needs.
  - The PON system helps the overall efficiency of the energy systems.
- Innovation in Design Credit 1 (1-4 pts).
  - The PON system utilizes less equipment, resulting in less raw materials, less garbage, less transportation and reduced time for implementation and commissioning.
  - In addition, utilizing a fiber system ensures the life of the system extends beyond the life of a conventional “switched” system.

Design Scenario Challenge

Challenge – Determine the quantity of each component required for Passive Optical LAN design

Assumptions:

1. Using pre-terminated fiber throughout
2. ONTs will be shared at Cubicles
3. ONTs will be mounted under the desks
4. ONTs will be locally AC powered
5. OLT is located in MDF
6. Raised floor throughout building

- Knowledge Check
What is survivability

• Survivability: the capability of a system or organization to withstand a disaster or hostile environment, without significant impairment of its normal operations.
Why Would We Need Survivability

POWER OUTAGES

Healthcare
Hospitality
Commercial Business and Education
Different Ways to Survive

- Local battery
- Remote:
  - Powered
  - Battery
  - Generator
- AC power on generator

“Emergency power”
Local Batteries
Local Batteries

- **PROs**
  - Place them only where needed
  - Low cost/commitment
  - May already be using UPS at desk
  - Does not require remote power for survivability

- **CONs**
  - Replacing when bad
  - Many more items to manage
  - Limited uptime
  - Battery failure
Remote Power

- Remote power means to power multiple ONTs from a DC power station which can be either distributed or centralized.
  - Distributed remote power is typically located in an IDF and can be powered with local AC or fed with DC power from the MDF
  - Centralized remote power is typically in the MDF and can feed distributed stations or directly feed ONTs at great distances
- Voltage options: 48vdc
Power Connectors

Locking preferred for remote power applications
Power Connectors

Non-locking connector introduces risk
Power Connectors

Be creative but not sloppy
48vdc Distributed

Distributed remote power with AC in IDF converted to 48vdc which feeds ONT
Centralized remote power with AC in MDF converted to 48vdc, which feeds 10/2 riser to 32 unit PDU in zone box, then to ONT.
Remote Power

• PROs
  – Survivability
  – Eliminates AC plug at ONT
  – Centralizes battery backup
  – Remote power reset of an ONT

• CONs
  – Added CapEx and OpEx cost and complexity
  – Introducing additional items to manage
  – Limited up time for UPS (needs generator for continued service)
  – UPS battery failure/replacement
  – Additional infrastructure
  – Backbone exceeds NEC Class 2 requiring conduit and an electrician (*note: 48v Distributed does not exceed NEC Class 2)
  – Difficult to capture remote power reqs in non low voltage sec. of project specs
  – Determining wire gauge for 48v Centralized backbone (10/2)
Remote Power Caution

• What happens when you have a coil of copper cable and send constant DC voltage through it?
• Trimming to avoid the coil means you’ve limited future flexibility
• Wattage is limited by gauge of wire so you’ve just removed future-proofing
• Not all ONTs are 48vdc!
AC Generator Power

• Alternating Current (AC) power
  • Installed on dedicated “emergency” circuits
  • Circuits fed from dedicated panels
  • Panels powered with dedicated feeders from generator power
AC Generator Power

• PROs
  – Survivability
  – Eliminates need for remote 48vdc power solution
  – Not limited to run time of battery

• CONs
  – Added cost / complexity
  – Requires licensed electrician to install vs. low voltage contractor
Rectifier Hardware Options
PDU Hardware Options
Cabling Options

• Solid vs. Stranded
• Hybrid composite cable
• Separate cables
• Use existing copper
Solid vs. Stranded Conductor
Solid vs. Stranded Conductor

Pictured: NOT what is meant by “stranded” RJ45.

Identifying Stranded VS. Solid RJ45's:

- Stranded: painted, shallow connectors pierce jacket & connect to strands
- Solid: longer, staggered connectors straddle conductor
Composite Cable
Separate Cables
Considerations for Cabling

• Will the copper and fiber originate in the same location? This will significantly impact your decision for Composite or Separate cables.
• Repurposing existing Cat-X cable as your power carrier is a benefit and reduces costs for cable and installation.
IDF Elevation

- Typical hospitality IDF will feed 3 floors
- 48vdc Distributed Remote Power
- Composite 18/2, 2-strand SM
Riser

- Fiber and remote power not originating from same IDF
- 48vdc Distributed Remote Power
- Not able to use composite cable
Deployment Methodologies

• Is power survivability really needed everywhere?
• Hybrid approach: use it where you need it.
• Maintain flexibility in your network.
Knowledge Check
Does a 48VDC remote power system fed by an AC plug in a TR require a licensed electrician for installation?

A. Yes
B. No
C. Sometimes
Does a 48VDC remote power system fed by a 48VDC source in a MTR require a licensed electrician for installation?

Importance of Cleaning

No. 1 cause of fiber network failures is contaminated connectors
- NTT-Advanced Technology Research, 2010

80% of network problems are due to dirty connectors!
Importance of Cleaning

Information courtesy of USCONEC, Hickory, NC. Used with permission.
Common Contaminants

- Dust
- Skin oil
- Alcohol residue
- Distilled water residue
- Vegetable oil
- Hand lotion
- Dryer lint
- Saltwater residue
- Graphite

SINGLEMODE FIBER

End face should be free of any contamination or defects,
Contaminate Transfers

Contamination transfers from the contaminated to the clean ferrule reducing optical performance.

Information courtesy of USCONEC, Hickory, NC. Used with permission.
Dirt on connectors moves to the middle of the ferrule!!!
Testing

- Key is to verify cable plant performance and connectivity
- Splitters are passive, usually trouble free
- Look for issues at connectors and jumpers
- Be aware if disconnecting before a splitter, a number of users on the channel will lose service
Testing

• Test in one direction. Light source at the OLT and power meter at the ONT locations.

• Ideally use a PON specific Light Source/Power Meter set to test 1310/1490/1550nm

• An alternate option is to use a standard Light Source/Power Meter at 1310nm and 1550nm

• OTDRs can be used for troubleshooting faults found in power meter testing, but are not used to certify links
Testing

• Testing with splitters: 3dB loss for each 1:2 split (excludes connections)

• ANSI/TIA 568C.3 = max .75dB per mated pair

• Singlemode cable = 0.5dB/km

• Bend insensitive cable can be helpful
Optical LAN Link Budget

- Max distance limited by attenuation, fiber loss. Splitters and connections contribute.
- Most budgets between 15.5 & 28dB; smaller splits and shorter cables require attenuators

* In addition to required fiber testing
Move, Add, Change (MAC) Testing

Once the splitter input is connection is made to the OLT, it cannot be disconnected for testing of MACs without disruption to the other users. When a move, add, or change is made on an active PON circuit, verification must be made to ensure that the proper range of power in dBm will be fed to the ONT. There is a minimum and a maximum value that is acceptable per ITU G.984X. This is verified by placing the connector that will connect to the input of the ONT into an Optical Power Meter and measuring the power in dBm to verify that it is between the minimum and maximum level.

Objectives

After successfully completing this course, you should be able to:

• Understand the differences between ITU and IEEE PON Standards
• Describe the ONT ranging and provisioning process
• Understand the basic steps for deploying a POL
• Understand the future PON standards
PON in Detail - Overview

Passive Optical Networks (PON) are standards-based communication architectures. There are literally tens of millions of subscribers utilizing PON for voice, video and data service (known as "triple play" service). PON networks rely on wave division multiplexing (WDM) and lasers to provide triple play services in an efficient and future proof service offering.
Standards – IEEE vs. ITU

• ITU and IEEE have separate standards for PON
• Both standards use the same passive infrastructure (fiber & splitters)
• The primary difference is the electronics
### Popular Standards Comparison

Standards Timeline

**IEEE**
- 2004 – EPON Standard Approved (1G)
- 2009 – 10G EPON Standard Approved (10G)
- 2012 – Extended EPON Task Force Formed

**ITU**
- 1995 – APON Standard Introduced (155M)
- 1999 – BPON Standard Approved (622M/155M)
- 2003 – GPON Standard Approved (2.4G/1.2G)
- 2010 – XGPON1 Standard Approved (10G/2.5G)
- 2013 – NGPON2 (40G TWDM)
WDM Methodology

- Multiple wavelengths over the same physical strand of glass
- Wavelengths do not interfere with each other
- Allows multiple discreet communications
WDM in PON

1490nm Downstream (TDM) – Voice, Data, Switched Video

1310nm Upstream (TDMA) – Voice, Data, Signaling Video

1550nm Downstream ONLY – RF Video

OLT

Video WDM

1x32 Splitter

ONTs
**PON Types**

- **BPON – (Broadband PON)** is an older version of PON technology which is based on ITU specifications and is characterized by an asymmetrical 622 Mbps downstream and a 155 Mbps upstream optical line rate. Earlier versions of Verizon’s FiOS™ offering in the U.S. are based on BPON but more recent implementations of FiOS use GPON technology.

- **GPON – (Gigabit PON)** is the latest ITU specified PON network and is characterized by a 2.4 Gbps downstream and a 1.25 Gbps upstream optical line rate. The first significant commercial deployments of GPON began in early 2008. Most carrier implementations of GPON are in the U.S. however it is beginning to proliferate in European markets as well.

- **EPON – (Gigabit Ethernet PON or GEPON)** is an IEEE standards based PON system characterized by a symmetrical 1.25 Gbps optical line rate. EPON is the predominant PON solution since it has been commercially available since 2001. GEPON has been primarily deployed in Asian Pacific markets. Recently, 10Gbit/s EPON or 10G-EPON was ratified as an amendment (IEEE 802.3av) in the IEEE 802.3 standard and provides for an asymmetrical 10 Gbps downstream/1 Gbps upstream rate as well as a symmetrical 10 Gbps rate.

- **WDM PON – (Wave Division Multiplexing PON)** is an emerging technology which leverages the optical advances of dense wave division multiplexing (DWDM) to provide a dedicated wavelength to a single ONT. Implementations range from “tunable” optics which must be matched to the ONT’s optics to a dynamic optical locking capability which automatically assigns a wavelength to the ONT at the ranging phase. WDM PONs utilize an arrayed waveguide grating (AWG) to multiplex up to 32 wavelengths of light onto a single fiber in the same way a passive optical splitter does. Unlike a typical optical splitter however, an AWG utilizes a phase shift in the optical light to provide an output on each fiber that only receives a certain wavelength of light.
Downstream Communication

The OLT transmits a signal downstream that all of the ONTs receive (point-to-multipoint). In the downstream direction, the information is broadcast on a specific color (wavelength) of laser light. The information is encoded into digital form and given a specific address that matches a specific ONT. The ONT that matches the address receives the signal and forwards the information to the end-user Ethernet port as depicted below.
Upstream Communication

Since many ONTs are placed on the same fiber, each with their own laser, upstream communications must be coordinated so that they do not interfere with each other. This is done by synchronizing the ONTs and requiring each to send information to the OLT (Upstream) in a specific time window (TDM). The upstream laser color is different from the downstream laser, so the upstream signal will not interfere with other ONTs on the PON. Using the WDM technique, ONTs do not interfere with each other; the upstream signals do not interfere with downstream signals, and the upstream and downstream signals can communicate at the same time (full duplex). This mechanism for converged, duplex communication is depicted below.
GPON Bandwidth

• GPON upstream bandwidth is directly correlated to TDMA time slot
• Each ONT will get a number of timeslots allocated. Each frame is 125µs in length

• Static bandwidth management
• Dynamic Bandwidth Allocation (DBA)
  – DBA is specified in ITU 984.3. This feature is used to grant upstream bandwidth to ONUs based on their demand
  – Used for oversubscribing GPON links
ONT Ranging Process

1. Authorize ONT to be on the PON
2. Determine distance from OLT
3. Setup OMCI communications
4. Assign bandwidth timeslots
5. Upgrade ONT software
6. Assign VLANs, QoS, PoE, security, etc.
RF Video

Additionally, an analog signal can be injected onto the same PON fiber, using yet another color of light (WDM techniques). This is called an overlay and is generally used to carry broadcast TV to the user’s location. As with data and voice propagation, the light is a different color and therefore does not interfere with the other signals being carried on the fiber cable.
RF Video

1. Video Source (Coax)
2. Laser Transmitter
3. Erbium Doped Fiber Amplifier (EDFA)
4. WDM
Centralized Administration

- Reduce Operations & Maintenance (O&M) by reduced the amount of equipment managed
  - ONTs are managed by the OLT
- No powered devices in the middle of the network
  - Same location as user
- Co-locate OLT with other IT gear
  - Same location as other gear
- OLT handles activation, administration, and provision
- No administration ports on ONTs
15 Minute Break

*Please respect others and return on time.*
Knowledge Check

• What is a VLAN?

• Difference between Layers 1, 2 and 3

• Have you provisioned a Cisco/Brocade/Juniper switch?
Templates & Profiles

- Templates and profiles allow admins to create common settings
VLAN Creation

- POL uses VLANs just like Ethernet switches
Uplink Provisioning

- Pick 1G and 10G Ethernet ports to connect to the core network
Uplink LAGs

• Add individual ports to Link Aggregation Groups

• Configure LACP
ONT Discovery

- ONTs will notify the OLT when they are connected
- Administrator determines next steps
ONT Ranging

- Know your ONT locations before they are deployed
- Assign a name and location as they are ranged
ONT Provisioning

- Assign VLANs once ONTs are ranged
Optical Levels

• OLTs and ONTs will report optical transmit and receive levels
• Provides basic indication of connection problems
• Not intended to replace cable plant certification
Type-B Protection

• Provides sub-80ms switchover protection between PON ports on same OLT
• Redundant OLTS an option
• Switchover between OLTS requires re-ranging
OMCI

- OLTs communicate with ONTs using ONT Management and Control Interface (OMCI)
- OMCI is part of the GPON standard and operating outside of GEM Ports
- OMCI is established after ONT is ranged
Bandwidth Assignment

• Bandwidth management is built-in to the GPON standard

• Required during provisioning
Bandwidth Management

Committed rates cannot exceed capacity of any link in the system.
Upstream Granting

• The “Grant” is the permission sent from the OLT to the ONT to:
  – Allow the ONT to transmit traffic in its assigned timeslot on the Upstream data train
  – Control the flow of Upstream traffic from the ONTs to the OLT so collisions of traffic from different ONTs on the PON do not occur
Traffic Flow

Internal switching separates POL from carrier PON vendors

1. Within ONT
2. Within PON Card
3. Within OLT
GPON Encapsulation

- VLANs mapped to GEM Ports
- GEM Ports assigned to traffic containers
- GEM Ports mapped to ONTs
Tagging, LLDP, PoE, QoS

- Tag VLANs from ONT
- Deliver power
- Configure connected devices with LLDP
- Customize QoS
STP & Loop Detection

- Full STP is not required in POL networks
- Loop detection is important
Multicast

- Multicast compliments PON topology
- OLTs and ONTs feature IGMP snooping
- Specific multicast VLAN required
Rules & Auto-Port Provisioning

• Auto-provision ONTs upon detection
• Set rules or selectors based upon ONT properties (location, model, etc.)
Converging Standards

- IEEE and ITU working to converge standards in future generations
- 10G EPON and XGPON use same PHYs
Future Standards

• EPON/GPON Networks can co-exist on the same fiber & splitters as 10G EPON/XGPON Networks
• 10G EPON and XGPON use same PHYs
• IEEE and ITU working to converge standards in future generations
• Next standards may combine multiple wavelengths in each direction for additional bandwidth
Complimentary Wavelengths

**EPON/GPON**
1490nm Down / 1310nm Up

**10G EPON/XGPON**
1577nm Down / 1270nm Up

**RF Video**
1550nm Down
Migration to 10G

- 10G PON can coexist on the same fiber as GPON
- Bandwidths available as 10G Downstream and 10G/2.5G/1G Upstream
- Uses same infrastructure/splitters as GPON
- Casual migration – upgrade only the ONTs that you want

# Test Results

## FasTest Report

### General Information
- **File name:** MandalayBay2.ots
- **Test date:** 3/30/2015
- **Test time:** 2:28 PM; 2:30 PM; 2:31 PM; 2:32 PM; 2:33 PM; 2:34 PM
- **Job ID:** AP 2.0 - Mandalay Bay
- **Cable ID:** AP 2.0 - Mandalay Bay
- **Fiber ID:** FIBER001, FIBER002, FIBER003, FIBER004, FIBER01
- **Customer:** Mandalay Bay
- **Company:** Sin City Cabling
- **Comments:**

## Location A
- **Location:** Wayne Newton
- **Unit’s model:** FOT-932
- **Unit’s s/n:** 767843

## Location B
- **Location:** Celine Dion
- **Unit’s model:** FOT-932
- **Unit’s s/n:** 774536
