Enhanced PoE Capabilities
Cisco Digital Building

Full UPOE
- Increased PoE Budget: 480W of UPOE (8 x 60W)
- Fanless, silent reliable operation with increased MTBF and system life (10 yrs)

Perpetual UPOE
- Provides non-stop UPOE power
- Switch can continue to provide power during configuration and reboot

Fast UPOE
- Restores power to powered device within 5 secs of power resumption

2-Event Classification
- Simplified power negotiation without LLDP
- Physical layer negotiation < 1s based on class/type

UPOE supports an Expanding Ecosystem of PoE devices

Digital Building Applications
- Wall Switch
- Commercial LED PoE Fixtures
- Dense Sensor Network (Light, Motion, CO2/CO, etc.)
- IP Video Surveillance Camera
- Building Mgmt (Connected HVAC)

Wall Switch

IP Video Surveillance Camera

Dense Sensor Network (Light, Motion, CO2/CO, etc.)
Power Over Ethernet – IEEE 802.3af/at (Future bt)

Mid-Span Operation

Non-Intelligent Ethernet Switches

- No Standards
- No State Data

Mid-Span

- Mid-Span Impact
  - Creates another failure point
  - Do not participate in Data Channel
  - Can’t share power information
  - Cost swap between PoE Switch and Mid-Span
  - Obscures power troubleshooting

Powered Devices (PD)
Existing POE Digital Building Endpoints

- IP Call Tower
- Temp Sensor
- Blind Motors
- Access Points
- IP Call Stations
- Facial Recognition Systems
- Light Fixtures
- Environmental Sensor Hubs
- Horns and Sirens
- Entry Barriers And Turnstiles
- Power Meter
- Biometric Door Locks
- Badge Readers
- HVAC VAV’s
- Meeting Room Nameplate
- Touchscreen PC’s
- Curtain Motors
- POE Displays
- IP Call Tower
- Cameras
- Ceiling Fans
Structured Cabling Considerations

- Cable Selection – Application based
- Pathway sizing and planning
- Bundles in pathway, racks, and cabinets
Digital Building Switches have a 5x Improvement in Switch Power

- Everything Active
  10% Power Saving.
  Efficient design, 80-Plus Gold Power Supplies

- No PoE Draw
  Switch Idle Mode with up to 50% savings

- Low Ethernet Traffic
  Power Savings with EEE or Energy Efficient Ethernet

- No Ethernet Traffic
  Switch Hibernate Mode with up to 75% savings
Deployment Models
Differentiated Access Layer Approaches

Building Management Systems
Cisco Network Architecture

1. Secure
BMS Fieldbus visible to IT and secured to prevent exploits on Enterprise infrastructure

2. Efficient
Converged infrastructure for IT & BMS applications
BMS network is a SD-Access extension over the enterprise fabric

3. Intelligent
Analytics combined with automation reduces time spent on troubleshooting
Identification/Security
IoT Device Business Challenges

- **Device Visibility**: Do you know devices well enough to differentiate service?

- **Intent-based Policy**: Does customer know behavior of devices to build their policy?

- **Standard based**: Is there any industry standard way of connecting IoT devices to enterprise network?

## Benefits

**Customer**
- Reduces threat surface of exploding number of devices
- Almost no additional CAPEX
- Standard approach to determining manufacturer intent
- Eases and scales access management decisions

**Manufacturer**
- Reduces manufacturer product risk at almost no cost
- Will increase customer satisfaction and reduce support costs
- Avoids the front page
- Standards-based approach
Codes and Standards
ASHRAE 90.1 (Similar to IEC)

This standard provides the minimum requirements for energy-efficient design of most buildings, except low-rise residential buildings. It offers, in detail, the minimum energy-efficient requirements for design and construction of new buildings and their systems, new portions of buildings and their systems, and new systems and equipment in existing buildings, as well as criteria for determining compliance with these requirements. It is an indispensable reference for engineers and other professionals involved in design of buildings and building systems.

Recent Changes:

Building Envelope
Envelope verification in support of reduced air infiltration and increased requirements for air leakage of overhead coiling doors.
Increased stringency requirements for metal building roofs and walls, fenestration, and opaque doors.
Improved clarity on defining exterior walls, building orientation, fault assumptions for the effective R-value of air spaces, and calculation procedures for insulating metal building walls.

Lighting
Modified requirements for exterior and interior lighting power densities to reflect new lighting levels in the IES Lighting Handbook.
Modified requirements for lighting control to add additional controls in some space types and options to others to allow easier application of advanced controls.

Mechanical
Large, electrically driven chilled-water plants are now required to be monitored for electric energy use and efficiency.
Dedicated outdoor air systems now include both efficiency and rating requirements for compliance.
Requirements are introduced for designs to include both use category and efficiency class.
Requirement that air-cooled DX cooling units with economizers have a monitoring system to determine that the air economizer is working properly.
ANSI/ISA-62443 (Formerly ISA-99)

ISA/IEC-62443 is a series of standards, technical reports, and related information that define procedures for implementing electronically secure Industrial Automation and Control Systems (IACS). This guidance applies to end-users (i.e. asset owner), system integrators, security practitioners, and control systems manufacturers responsible for manufacturing, designing, implementing, or managing industrial automation and control systems.
Deployment Example
Marriott Sinclair Hotel (Autograph Collection)

Project Overview

- 1920’s Art Deco Building in the heart of downtown Fort Worth
  - Rooff Top Bar
  - Restaurant
  - High-end Spa
- Designated in the National Register of Historic Places
  - Need for minimally invasive renovations to preserve historic value
- Technology drives Customer Satisfaction and Repeat Business
  - High Speed Internet, Room Automation, Scene Control
- Low Voltage Lowers Construction Costs

<table>

- Faster Installation
- IP Enables Systems Integration and Better Management
  - Greater Energy Efficiency
  - Granular Controls
  - Enables Guest Room Automation
  - Increased Property Management Capabilities
  - Provides a Sustainable Message

Customer Profile Video: https://www.youtube.com/watch?v=uomF2xznbB8

Notes:
1) Inclusive of Labor and Materials for the infrastructure.
2) Infrastructure Powers: Lighting, Motorized Blinds/Curtains, MiniBar, TV embedded Bathroom Mirror, Door Locks, Shower Valve
3) Device Costs (AC/POE comparable)
4) DC Infrastructure Electrical Costs include backup AC Outlet for Minibar and Bathroom Mirror in case that POE versions are not ready in construction timeline. An additional $200,000 savings (yielding 35% Savings over AC Infrastructure) would be had if these electrical circuits were not installed.
5) Building Electrical service changed from 4000A service to 2500A service.
CompuCom Digital Campus  Charlotte, NC
Leveraging Technology and Innovation to Drive Collaboration, Productivity and Operational Efficiency

Challenge
- Enable a vision of the modern workplace
- Meet construction deadlines
- Incubate and advance digital workplace technologies and services

Solution Implemented
- Cisco’s Digital Building Switches
- PoE Lighting
- Ethernet Building Field Controllers
- Extensive Cisco Collaboration, Networking, Wireless
- PoE Access Control and Physical Security

Results
- Tree’s to keys in under 12 months
- Reduced Labor by two-thirds saving $275,000
- 16% less expensive overall per square foot than previous project

Summary
Digital Transformation must be part of your Building and Cities Strategy

- Buildings and Cities are changing
  - IT and OT teams need to work together
  - Buildings and Cities are become digital
- Digital Transformation is essential in the Communities of the Future
- The Smart Infrastructure will be play a major role
- Talk to new people!!
- Build an Ark, Change the world!!

Cabling for Remote Powering

Carol Everett Oliver, RCDD, ESS
Network Cabling Specialist
Agenda

• Remote Powering

• Impact on Cabling

• Intelligent Buildings & Standards

• Converged Cabling Designs
Advantages of Remote Power/PoE

• Running power concurrent to data over structured cabling
• The cost of a power outlet includes conduit, wire, a back box for the outlet and the labor of an electrician
  • The average cost to provide typical power to a device is about $1,000
  • The average cost of a PoE network port plus the structured cable drop is $250 per drop
Quiz Question #1

What are the four IEEE PoE power levels (W)?

A: 15, 30, 60, 90
## Existing IEEE PoE Applications

<table>

\(^1\) Under development via IEEE 802.3bt
PoE Lighting: Unleashing Cost and Integration

• Delivers significantly lower capital and labor investment
• LED lights consume half the energy of fluorescents and last 5X longer
• Earth and tenant friendly with less emissions and no hazardous mercury
• Integrates with other IoT applications and can receive centralized IT back up power

Upfront Cost Comparison for a 35,000ft² building in New York City
PoE Lighting: Unleashing Cost and Integration

• Centralized control
• Occupancy sensors
• CO₂ sensors
• Humidity sensors
• Daylight harvesting
• Energy consumption
• LiFi network connectivity
• Intelligence to adapt to patterns and preferences
• Color coding and flashing patterns for security and/or threat level notification
Agenda

• Remote Powering

• Impact on Cabling

• Intelligent Buildings & Standards

• Converged Cabling Designs
Implications of Remote Powering

• Heat builds-up within cable bundles

• Bundle sizes may need to be reduced to improve heat dissipation

• Overall channel length may need to be reduced to offset increased insertion loss resulting from a higher operating temperature

• Contact arcing occurs when un-mating pairs under load and may affect connecting hardware reliability
Quiz Question #2

What is the TIA specified operating temperature range for cabling?

A: -20°C to 60°C (-4°F to 140°F)
Temperature Rise Considerations

• Remote powering can cause heat build-up within cable bundles
• Cabling insertion loss increases at temperatures above 20°C/68°F
• The temperature of any cable should not exceed the temperature rating for the cable
  • Generally, cables used in commercial premises have a temperature rating of 60°C
  • Exceeding a cable’s specified operating temperature may result in long term cable degradation
  • Cables with higher temperature ratings are listed and marked accordingly
  • Exceeding 60°C/140°F DOES NOT result in cables melting or safety risks
PoE Cable Temperature Rise

**Temperature Rise vs. Current in 100-Cable Bundle**

- **Type 2/3**
- **Type 4**

**Category 5e**
- **Category 6**
- **Category 6A UTP**
- **Category 6A F/UTP**
- **Category 6A UTP, slim profile**
- **Category 7A S/FTP**

---

2019 BICSI Winter Conference & Exhibition
January 20-24 • Orlando, FL, USA
Channel Length De-Rating

- **TIA, ISO/IEC Category 6A U/UTP**
  - Subtract 18 m at 60°C/140°F

- **TIA, ISO/IEC Category 6A F/UTP**
  - Subtract 7 m at 60°C/140°F
Potential for Arcing Under Load Conditions

- Remote powering applications do not apply DC power until a PD is sensed by the PSE
- Device disconnections can’t be anticipated
- “Un-mating pairs under load” produces an arc as the applied current transitions from flowing through conductive metal to air before becoming an open circuit
- Arcing can result in corrosion and pitting damage on the plated contact surface at the arcing location
Ensuring Contact Integrity

- Informative Annex B of TSB-184-A contains the following guidance:
  - Connecting hardware having the required performance for mating and un-mating under the relevant levels of electrical power and load should be chosen
  - IEC 60512-99-001 is referenced as a suitable test schedule
Standards Resources

• NFPA 70 (2017 NEC)

• TIA TSB-184-A-2017

• TIA-569-D-2-2018
2017 NEC Code Revisions

• Cable Ratings and Markings for Safety
• Ampacity Table for Bundles

Part VI. Premises Powering of Communications Equipment over Communications Cables

840.160 Powering Circuits. Communications cables, in addition in carrying the communications circuit, shall also be permitted to carry circuits for powering communications equipment. Where the power supplied over a communications cable to communications equipment is greater than 60 watts, communication cables and the power circuit shall comply with 725.144 where communications cables are used in place of Class 2 and Class 3 cables.
2017 NEC Table 725.144

• Conductor gauge, bundle size and temperature rating are used to establish a safe power rating (Ampacity) for each conductor

Alternatives

1. Use cables with a larger conductor or higher mechanical rating
2. Reduce bundle size
TIA TSB-184-A

• *Guidelines for Supporting Power Delivery Over Balanced Twisted-Pair Cabling* (March 2017)

• The standard presumes a maximum ambient temperature of 45°C/113°F in conjunction with cabling with a maximum rating of 60°C/140°F, thus allowing a maximum temperature rise of 15°C/27°F on any cable within the bundle due to dc powering
  
  • The maximum ambient temperature along the link (length of at least 1m) should be used as the basis for the calculation
Mitigation Recommendations

• Use Category 6A or higher-performing 4-pair balanced twisted-pair cabling
• Install shielded cables
• Reduce channel length, as necessary, to offset increased insertion loss
• Minimize cable lengths in order to reduce dc loop resistance
Mitigation Recommendations

• Leave cables unbundled
  • If bundling, smaller bundles are recommended

• Limit the number of cables per bundle to 24
Cable Bundle Recommendations

- When in doubt about cable mechanical or heat dissipation capability, installation environment, or remote powering application, a conservative practice is to limit maximum bundle size to 24 cables.
Mitigation Recommendations

• Use open wire tray or similar cable management that provides for largely unrestricted airflow around the installed cables
  • Disperse cables evenly across the width of the tray

• Reduce maximum operating temperature

• Mix unpowered cables with powered cables
TIA-569-D-2-2018

• Additional Pathway and Space Considerations for Supporting Remote Powering Over Balanced Twisted-Pair Cabling (July 2018)

• Pathways differ in regard to geometry and contact area between cables, pathway, and air

• Provides general guidance on heat dissipation of various pathways by bundle size

Media Selection

• TIA TSB-184-A-2017
  • Category 6A recommended

• TIA-862-B-2016
  • Category 6; category 6A recommended

• ISO/IEC 11801-6 Ed1.0
  • Class $E_A$ or higher

• BICSI 007-2017
  • Category 6A/Class $E_A$ or higher recommended
Benefits of Shielded Cabling

• Typically qualified for higher temperature (75°C) operation

• Reduced length de-rating

• Superior heat dissipation supporting larger bundle sizes
Agenda

• Remote Powering

• Impact on Cabling

• Intelligent Buildings & Standards

• Converged Cabling Designs
Planning for Intelligent Buildings

• Design 10-15 years out
  • Allow for additional systems and cabling
  • Plan for future builds
  • Accommodate future applications
Quiz Question #3

What is the TIA standard for the Structured Cabling Infrastructure Standard for Intelligent Building Systems?

A: ANSI/TIA-862-B-2016
Quiz Question #4

What is the BICSI standard for the Information Communication Technology Design and Implementation Practices for Intelligent Buildings and Premises?

A: BICSI 007-2017
Meeting Applicable Codes & Standards

• ANSI/TIA-862-B “Structured Cabling Infrastructure Standard for Intelligent Building Systems”

TIA-862-B-2016

• *Structured Cabling Infrastructure Standard for Intelligent Building Systems*
  • Change of title (was Building Automation Systems Cabling Standard)

• General substitution of the term “intelligent building system” for the previous term “building automation system”

• Addition of guidance for cabling for:
  • Wireless systems
  • Remote powering over balanced twisted-pair cabling
  • Smart lighting

\(^1\) A TO must always be present even if a CP is present
\(^2\) An EO is optional if an HCP is present
ANSI/BICSI 007-2017

- Technology Design and Implementation Practices for Intelligent Buildings and Premises
- Communications Infrastructure & Network Integration
- Design Considerations (Power, Data, Zone Cabling)
- Building Systems (Lighting, Digital Signage, Vertical Transportation, Sound Systems, ESS, etc.)
- Building Monitoring Systems
- Commissioning
Agenda

• Remote Powering

• Impact on Cabling

• Intelligent Buildings

• Converged Cabling Designs
What is Zone Cabling?

Zone cabling supports convergence of data and voice networks, wireless (Wi-Fi) device uplink connections, and a wide range of sensors, control panels, and detectors for lighting, security, and other building communications.
What is Zone Cabling?

Patch Panel in a TR

(H)CP Housed in a Zone Enclosure

Device Outlet
Zone Cabling Methodology

- Zone cabling is a standards-based approach to support convergence of devices.
- Consists of cables run from connections in the telecommunications room (TR) to outlets housed in a zone enclosure servicing coverage areas.
- Shorter cables run from outlets in the zone enclosure directly to devices or to outlets servicing devices.

- 25% spare port availability recommended for best ROI.
- Supports rapid reorganization and deployment of new devices and applications.
- MAC work costs less, is faster and less disruptive.
- Factory pre-terminated and tested trunking cables can be installed from the TR to the zone enclosure for quicker deployment.
Zone Cabling Considerations

• A coverage area radius of 13m is generally recommended as an optimum size to accommodate most converged cabling networks

• Number of connections within the zone enclosure should not exceed 96

• Need to factor in future expansion

Quiz Question #5

What is an MPTL?

A: Modular Plug Terminated Link
Modular Plug Terminated Link
Modular Plug Terminated Link (MPTL)

• The MPTL is constructed by direct field termination of horizontal cabling at the device end with a modular plug - replacing the TO/SO and associated Work Area (WA) cord.

• ANSI/TIA-568.2-D requires that horizontal cable be terminated onto a TO. In certain cases there may be a need to terminate horizontal cables directly to a plug.

• ANSI/BICSI-007 recognizes the MPTL and refers to it as a direct connection method, with or without an HCP.

• ANSI/TIA-862-B-2016 recognizes direct connections – should be limited to devices in fixed locations that are not expected to be replaced or required to be directly connected by the AHJ
What are the market drivers?

- IoT and Intelligent Buildings are driving the proliferation of IP-based and PoE-based devices in the walls and ceilings of modern buildings.

- LED lights, security cameras, wireless access points, digital displays, distributed antenna systems (DAS), building automation control devices and more can be directly connected using plug-terminated links rather than via boxes, outlets and patch cords.
What are the benefits of an MPTL?

- Custom length, quick connections in the field for direction connection to devices
  - Ideal for a zone cabling design methodology
  - Can be plugged into the zone enclosure on one end and terminated to outlets on the other end for computers, phones, etc.
  - Simplifies project bill of materials and eliminates the need for predetermined patch cord lengths
- Improves performance and allows for more efficient power delivery by eliminating patch cords and outlets
- Improves security for devices like surveillance cameras by eliminating exposed patch cords

Photo taken at McCarran Airport in Las Vegas – Anyone could jump up and pull out the patch cord to the surveillance camera and wireless access point.
Quiz Question #4

What type of rating must a product have to be installed within a plenum environment?

A: A plenum rating!
Plenum Products
Summary

• Increasing numbers of IB applications will run over a low voltage RJ-45 platform

• Remote powering places increased demands on network cabling systems

• Zone cabling provides a flexible infrastructure

• Modular plug terminations have a role

Quiz Questions

• What’s the power available at the PD for Class 3?
  • 13W

• Based on 802.3bt, what class of power is available from a PoE++ device?
  • Class 5 or 6

• How many pairs are used in Class 4 implementations?
  • Two or Four
Power Over Ethernet

• IEEE 802.3bt – 4 pair Power over Ethernet
  • Now technically complete and no new features to be added
    • Type 1 and Type 2 PSE devices are as per 802.3af and at standards
    • Type 3 and Type 4 PSE devices added, 60W and 90W respectively
      • Updated end types to support 2.5G, 5G and 10G Ethernet
      • New midspan PSE to support the higher speeds
    • Warning added not to use smaller than 26AWG cabling with PoE
  • Out for sponsor ballot, expected to publish Q3 2018.
PoE Confusion

• Not a Licensed Term
• Three Standards: 802.3af, 802.3at, 802.3bt
• Eight Classes / Wattage Levels
• Four Types: 1 and 2 (two pair), 3 and 4 (four pair)
• Common Names: PoE, PoE+, PoE++, UPOE
• Passive, LLDP, and Negotiated Implementations
• Interoperability?

Ethernet Alliance Certification

Resistance Testing for PoE
Four Pair PoE in Operation

- The powered device completes the current loop, enabling the device to work.

- The current is “balanced” across all 4 wires used.

- Requires low and balanced cable resistance.
Cabling Requirements

• Your standard Cat 5e, 6, or 6A field test is probably not good enough
• Within ANSI/TIA-568.2-D and IEEE 802.3, you will find:
  • dc loop resistance
  • dc resistance unbalance within a pair
• The measurements are “optional” in TIA-1152-A
1. Loop Resistance

All Four Pairs < 25 Ω
2. P2P Resistance Unbalance

\[
\text{Resistance Unbalance}_{\text{between pairs}} = \left[ \frac{|R_{P1} - R_{P2}|}{R_{P1} + R_{P2}} \right] \times 100\% 
\]

All Six Measurements < 0.2 Ω or 7.5%
3. Pair Resistance Unbalance

\[ \text{Resistance Unbalance}_{\text{within a pair}} = \left[ \frac{|R_{c1} - R_{c2}|}{R_{c1} + R_{c2}} \right] \times 100\% \]

All Four Measurements < 0.2 Ω or 3.0%
Problems Resulting From Resistance Issues

• Overheating

• Power Loss

• Data Loss

Questions
Thanks for Your Attention
End Products and Security

Geoffrey Bauer, ESS, PSP
Manager, A&E Program
Axis Communications
Internet of Things (IoT)

• 50 Billion Internet Of Things Connections Projected By 2022
  (www.mediapost.com)
Internet of Things (IoT) - Security
We need more power

- 15W 802.3af/802.3at Type 1
- 30W 802.3at Type 2
- 60W 802.3bt Type 3
- 90W 802.3bt Type 4
PoE Midspan devices

- PoE “injector” options
  - 15W (IEEE 802.3af)
  - 30W (IEEE 802.3at) PoE+
  - 60W (IEEE 802.3bt) PoE++
  - 90W (IEEE 802.3bt)

- Midspans are either unmanaged or managed out of band
  - PoE is managed as part of the data path and the statistics show up as part of the line communication and on the switch
    - Midspan power information has to come from the midspan or through a separate tool
Physical Security

“Detect”
PoE Intrusion Monitoring

• **Motion Detectors**
  - Powered by the device (camera) via the I/O port
  - Z-Wave Connectivity (wireless to PoE device)
  - Hidden sensors for video (covert)

• **Laser scan detector**
  - Detects object's size, speed, and distance

• **LIDAR & RADAR**
  - Delivers exact position of a moving object
  - Minimizes false alarms from spiders, small animals
  - Reliable detection even in bad weather (rain, fog, snow)
Monitoring and Control

“Detect” and “Deter”
Network Input / Output control

- Powered using PoE/PoE+ (or external power)
  - Analog alarm inputs
    - Supervised / Non-supervised inputs
      - Door contact, Window sensor, Motion detector, all things analog
  - Relays
    - TTL and Form C relays
      - Typical 12VDC / 24VDC / Dry contact relays
    - Trigger analog audio devices
    - Trigger analog lighting displays
    - Trigger ADA release sequence for entry doors
  - Elevator Control
    - Control what floors are accessed
    - Provide details of persons movement
IP Surveillance

IP Cameras for the “eyes”
Types of cameras

- Covert
- Fixed Box
- Fixed Dome
  - Panamorph
  - Multi-Sensor
  - PTRZ
- Bullet
- Thermal
- Positioning
  - Dome
  - Bi-spectral
  - Professional AV
- Explosion proof
PoE requirements for Surveillance
PoE requirements for Surveillance

• Positioning Camera
  • SFP or RJ45 10BASE-T/100BASE-TX/1000BASE-T network connector
  • 24VAC/VDC Max 200-300 W, typical 16-64 W (IR)
    • Temperature: Normal: -50 °C to 55 °C (-58 °F to 131 °F)
      • Arctic Temperature Control: start-up at -40 °C (-40 °F)
  • Operational wind load of 106mph
  • Precision motors with presets
  • Bi-spectral
How does more power influence project designs?

Using surveillance as an example ...
Resolution
Wide Dynamic Range

WDR - On

WDR - Off
Image stabilization
Low-light

• Indoor storeroom at approximately 0.4 lux.
IR illumination
Operational in extreme cold and extreme heat
Long-range video surveillance
Thermal
Video compression
Intelligent Applications

> Edge processing
  • Access to applications at the edge
    • Present a wide range of intelligent applications for efficient surveillance, data analysis and business management
    • Open platform allows for application development partners to meet specific needs

> Adapting to the IoT world will require the ability to connect in ways beyond standard security

> Almost all of the enterprise customers desire customization to accomplish business goals
Decoding

“Detect”
PoE Decoders

• Decoding
  • Connecting digital monitors to display live video from network cameras
Access Control

“Delay”
PoE Controllers

> Door connections
  • Request-to-Exit
  • Door Position Switch
  • Card Reader
  • Emergency Door Release
  • Power for Electric Lock (Strike)
PoE Door Devices

• RFID Door Readers
• Biometric Readers
• Door Locking Hardware

• Electromechanical / Card Reader
  • Power when required
  • Part of complete solution
    • Requires management software
PoE Controllers

> Powers door devices
  • Request-to-Exit motion
  • Card Reader
  • Power for Electric Lock (Strike)

> Runs autonomous from software
  • Controls access to access portal
    • Stores cardholder records
    • Stores time schedules
    • Stores user permissions
  • Alarm and Relay Linking
  • Event recording
IP Intercom
Devices for “Communication”
Types of IP Intercom

• Facility
  • Building entrance
    • Front / Employee / Dock doors
  • Remote building Remote gate
  • Parking Garage
  • Parking Lot

• Residence
  • Entry gate
  • Apartment call center

• Management
SIP Communication – an overview

• **Session Initiation Protocol**
  • SIP is the standard protocol used in Voice over IP (VoIP) applications and unified communication platforms.
  • Initiate, maintain and terminate sessions between clients
  • Usually audio, but video too
  • SIP phones, Intercom devices, Audio, Radio-over-IP, etc.
IP Audio

La ...la ...la ...la
PoE Loudspeakers

• “See something ... Say Something”
  • Extending the reach of a security program
    • The loudspeaker can be remotely accessed and/or play a pre-recorded audio file when it is manually or automatically triggered (alarm event)
  • Compatible with major video management software and SIP-based VoIP systems
  • Address individual speaker from anywhere with network connectivity
PoE Speakers

- PoE (IEEE 802.3af/802.3af Type 1 Class 3)
- A complete audio system
  - Speaker
  - Amplifier
  - Signal processing, equalization
  - Microphone
- Streaming audio
- Customized announcements
PoE Speakers

Traditional analog speaker solution

- Speaker
- Speaker audio cable
- Amplifier
- Line level audio cable
- Tone control / Equalizer
- Line level audio cable
- Streaming box
- Network cable
- Network switch

Network speaker solution

- All-in-one
- Network cable
- Network PoE switch
IP Lighting
PoE Lighting - Security

Security
  - Visible Light
    - 802.3af compliance – draws 12W
  - IR (850nM or 940nM)
    - 802.3af compliance – draws 12W
PoE Lighting - Buildings

> Intuitive sensors to learn and interact
  • Occupancy – turn on and off
  • Dimming – adjusts to ambient lighting
  • Color temperature
  • Business analytics

> Efficient
  • Dramatic energy savings

> Installation
  • Eliminate heavy duty copper wire and conduit used for traditional lighting

> Flexibility
  • Ability to easily move or replace fixture

Wired
Chinese hacking of US media is 'widespread phenomenon'
— Wired, Feb 2013

THE WALL STREET JOURNAL
NASDAQ Confirms Breach in Network
— The Wall Street Journal, Feb 2011
What is cybersecurity?

• Cybersecurity refers to a set of techniques used to protect the integrity of networks, programs and data from attack, damage or unauthorized access.

• Cybersecurity involves mitigating risks by reducing the attack surface area, or more simply – by reducing exposure.

• Cybersecurity cannot be defined as a single product or tool.
What is cybersecurity?

• It is important to understand that 100% protection against intrusion is very hard to achieve, if indeed possible at all.
IoT and Network Device Cybersecurity Concerns

> Unsecured endpoints used as a point-of-entry on the network
> Poor password complexity protocol
> Open ports and unused services
> Man-in-the-middle packet capture
> Malware
> UDP-flood, DoS, DDoS
Where should I start?

• To protect a network against attack, various security controls can be implemented. These controls are safeguards or countermeasures to avoid, detect, or mitigate secure interest to **physical property**, **networks**, appliances, servers, information, or other assets.
Where should I start?

• In a security system, the main areas to focus on are:
  • **Physical exposure** - protecting the system hardware
  • **Network exposure** - preventing unauthorized access
  • **Service exposure** - preventing access via unused services
  • **Encryption** - securing transmission to/from appliance
  • **Credentials** - the use of robust credentials
  • **Authentication** - authentication policies (certificates)
Where should I start?

• Physical
  • The first line of defense is the physical protection of the primary access points to your network
  • Various measures may include:
    • Secure network equipment and servers
    • Mounting appliances out-of-reach
    • Using tamper switches
    • Using vandal-resistant enclosures
    • Use protective shielding for exposed cabling
    • Protect the cable ends and open ports
Where should I start?

• Network
  • The second line of defense is protecting your network infrastructure from unauthorized access
  • Various measures may include:
    • Protect the perimeter
      • Control access to the facility - Manage who comes and goes
      • Video Surveillance – Record the identity of each person
    • Protect the interior
      • Conceal cabling - Structured cabling should be out of sight
    • Control access from public and employees
      • Physically secure MDF/IDF locations
      • Control access to internal sensitive areas
      • Security at the cabinet level
Final thoughts ...

- IoT drives appliances to the network
  - Integration between appliances transitions from “Analog” to “Digital”
  - IPV6 implementation is absolutely necessary
- PoE will continue to drive edge-based technology
  - Security industry is quickly adapting and innovating
- PoE will challenge the status-quo
  - Video / Audio / LED Lighting / Automation / Smart buildings / BYOD
- PoE standards will recognize higher power requirements
- PoE requires different design considerations
- Cyber threats will keep you up at night
Thank you!
