# Curing Common AV Headaches 

Providing systems that will get used and make everyone happy BUDGET CONSCIOUS | EASY TO USE | FUTURE PROOF | NEXT GENERATION | PROTECT YOUR REPUTATION

## Common AV Headaches

| Headache | Prescription |
| :--- | :--- |
| Accommodating odd room sizes | Adding displays and speaker placement |
| New AV technologies not supported by old AV cabling | HDBaseT extension on Category cable |
| Hard to share content/collaborate | Auto and manual input switchers |
| Video looks great, audio sounds terrible | Audio extraction, amps and speakers |
| Grounding and bonding of shielded cable | UTP cable with crosstalk prevention tech |

## Accommodating Odd Room Sizes

Adding displays
Display or projector placement and size

## Accommodating Odd Room Sizes

- Every room presents a different challenge
- The audio element is just as important as the video element
- Consider the viewer experience but also consider the presenter
- Maintain the focal point and purpose

## Accommodating Odd Room Sizes

## Fixing the Bowling Alley

Flat screen displays (Qty 2 or 4)

HDMI splitters
(Qty 1 or 2)
HDBaseT Extension
(Qty 1 or 2)
HDMI cables
(Qty 5 or 6)

Maintain the focus at the presenter | Provide detail for every participant

## Fixing the Bowling Alley

## Accommodating Odd Room Sizes

## Fixing the Training Room

A. Flat screen displays (Qty 2)
B. HDMI splitter (Qty 1)
C. HDMI cables (Qty 2 or 3 )

Clear the view for all participants and provide sharp detail

Maintain focus on the presenter

## Fixing the Training Room

## Choosing the Correct Screen Size

## Where will the viewers sit?

- Maximum viewing distance
- Maximum viewing angle
- Make sure the viewing angle of the viewer falls within the viewing angle of the display or projection screen

## What will the viewers do?

- Critical - detailed engineering drawings or spreadsheets
- Reading - presentation slides
- General - training videos or movies

## Screen Size and Aspect Ratio

- 4/6/8 Rule of Thumb
- Critical : Min. Screen Height x $4=$ Max. Viewing Distance
- Reading: Min. Screen Height x $6=$ Max. Viewing Distance
- General : Min. Screen Height x $8=$ Max. Viewing Distance
- Aspect Ratio (AR) is the ratio of width (W) to height (H)
- NTSC:

$$
4 / 3=1.33
$$

- HDTV:
$16 / 9=1.78$
- Cinemascope:
$2.35 / 1=2.35$

Find the missing screen size!

1. Solve for Screen Height
2. Calculate Width
3. Determine Diagonal Size

## Solving for Display or Screen Size

1. We start with max distance

$$
20^{\prime}=240^{\prime \prime}
$$

2. Solve for required height using the

$4 / 6 / 8$ Rule of Thumb ( $\mathrm{H} \times(4,6$, or 8$)=$ Max Distance)

- $H=$ Max Distance $/(4,6$, or 8$) \quad 240^{\prime \prime} \div 6=40^{\prime \prime}$

3. Solve for the width using the aspect ratio ( $\mathrm{W} / \mathrm{H}=\mathrm{AR}$ ), in most cases HDTV (16 / $9=1.78$ )

- $W=H \times A R$

$$
40^{\prime \prime} \times 1.78=71.2^{\prime \prime}
$$

4. Use Pythagorean Theorem ( $\mathrm{H}^{2}+\mathrm{W}^{2}=\mathrm{D}^{2}$ ) to solve for the diagonal size (D)

- $D=\sqrt{\left(H^{2}+W^{2}\right)}$

$$
\sqrt{(71.2)^{2}+(40)^{2}} \approx 82^{\prime \prime}
$$

## Classroom Example

- Students in the back row are 24 feet from the screen
- They will be looking at slide presentations
- The client plans on an HDTV format display

## Classroom Example

1. Use $6 \times$ Rule of Thumb for Reading to get recommended screen height (Max Distance / $6=\mathrm{H}$ )
a) Find the Height $24^{\prime} / 6=4^{\prime} \mathrm{H}$
b) Find the Width for HDTV
$4^{\prime} \mathrm{H} \times 1.78 \mathrm{AR}=7.12^{\prime} \mathrm{W}$

2. Find the diagonal using the Pythagorean Theorem $\sqrt{\left(H^{2}+W^{2}\right)}$
a) $\sqrt{\left(4^{2}+7.12^{2}\right)}=\sqrt{(16+50.7)}=\sqrt{(66.7)}=8.17^{\prime}$
b) Convert feet to inches by multiplying by 12
$8.17^{\prime} \times 12=98$ inches
7.12'

We need a display or projector screen of at least 98" diagonal

## Thank Goodness for the Internet

1. Max Viewing Distance $=24^{\prime}$
2. Min Screen Height

- $24^{\prime} / 6=4^{\prime}\left(48^{\prime \prime}\right)$

3. Aspect Ratio $=1.78$
4. Screen Width

- $4^{\prime} \times 1.78=7.12^{\prime}\left(85.5^{\prime \prime}\right)$

5. Internet Search
"Pythagorean Theorem calculator"
Min display size 98" diagonal
```
Pythagorean Theorem
```

Solve for hypotenuse -
$c=\sqrt{a^{2}+b^{2}}$
$a$ Leg Enter value
$b$ Leg
Enter value
Pythagorean Theorem
Solve for hypotenuse -
$c \approx 98.05$
$a$ Leg
$b$ Leg

Pythagorean Theorem
Solve for hypotenuse -
$c \approx 98.05$
$a$ Leg
$b$ Leg

# New AV Technologies Not Supported by Old AV Cabling 

Moving on from VGA
Passive HDMI cables are not enough
HDMI extension - plug and play

## Video Extension Options

- Why are HDMI Cords not enough?
- Distance
- Retrofit
- What solutions are available that require an AV staff to support?
- Traditional distribution amplifiers and matrix switches
- What solutions are available that the IT team can support?
- Video over Ethernet/IP
- Wi-Fi
- What if there is no AV or IT staff to support?
- Dependable plug-and-play solutions

## Moving from a VGA to HDMI Projector

- $1 / 2^{\prime \prime}$ conduit in the wall
- VGA cable (field terminated)
- But, the HDMI cable connector is huge
- At least 7/8" diagonal
- Oh oh!

## HDBaseT - More than Just Video and Audio

## Moving from VGA to HDMI Projector

- $1 / 2^{\prime \prime}$ conduit in the wall
- Not a problem for Cat 6A cable
- But remember the properties of HDBaseT
- Like 10GBaseT
- Alien crosstalk

## Moving from VGA to HDMI Projector

- HDMI Cable
- Category Cable

## Moving from VGA to HDMI Projector

If you still have VGA devices - no problem - use an HDBaseT transmitter with built-in VGA to HDMI scaler

- HDMI Cable
- Category Cable
- VGA + Audio Cable

## The Distance Headache - HDMI Cables

- When the source is right next to display? All is good!

- When the source is remote from the display? Not so good!

Max recommended HDMI cable length for dependable performance is $15^{\prime}(5 \mathrm{~m})$ at 1080 p

## The Distance Headache - Cured!

- 100m HDBaseT Extender Solution - Leviton 41920-HTE
- Single Cat 6A UTP cable
- Powered from either end (PoH)

# Hard to Share Content / Collaborate 

Multiple input switching

## Collaboration and Huddle Spaces

- Popularity of impromptu meeting spaces and remote collaboration
- Attempting to share wirelessly or connecting directly to the display
- Security concerns for both
the network and guest devices

## Automatic Sharing (Switching)

## Controlled Sharing (Switching)

## Controlled Sharing (Switching)

Bicsi

## Display Sharing - 4 Input Sources

## Video Looks Great!

 (Audio Sounds Terrible)Eliminating lip sync
Audio extraction
More speaker and amp options
Multiple levels of volume control
Speaker Layout

## Eliminating the Lip Sync Headache

- Lip Sync: technical term for matching a speaking or singing person's lip movement to the audio heard by the listener
- Can be video or audio delay - usually video delay due to signal processing at the display or projector
- Simplest and least expensive cure: Utilize the
 audio output from the video display device

## Eliminating the Lip Sync Headache

## Eliminating the Lip Sync Headache

## Adding More Speakers

## Even MORE Speakers!

- 70V amplifier supports many speakers up to 40 watts
- Mono output
- Simple daisy chain with $16 / 2$ wire
- Select appropriate transformer tap to adjust level for various areas

| - HDMI Cable |
| :--- |
| - Audio Cable |
| - Speaker Cable |

## Headache: Microphones

- Leviton audio amplifiers are mixing amplifiers
- Multiple inputs including mic
- Each input controllable for level and tone
- Mic input supports:
- Dynamic mic
- 48V phantom power for a condenser mic
- Line level input
- Ducking function on 70v

```
- HDMI Cable
- Audio Cable
- Speaker Cable
```

## Multiple Volume Controls

- Best to have 1 volume control
- But many sources have their own volume control
- Add a display or projector and amplifier - yet another headache!

## Layered Volume Control

- If possible, take the remote out of the equation by using display settings to set a constant audio output level (line out)
- Set source to mid level
- Set amplifier to lowest setting and set display output level to maximum without distortion
- Adjust amplifier for appropriate listening level and if needed adjust display output level again for no distortion

## Speaker Layout Example

- $26^{\prime} \times 20^{\prime}$ Classroom size
- Students will be seated, but will sometimes move around in a technical lab atmosphere
- How many in-ceiling speakers do we need?
- What is the distance between in-ceiling speakers?

## Speaker Layout

- Sitting or standing?
- Sitting - 3'6" standard height
- Standing - 5'6" standard height
- Identify speaker dispersion angle
- Determine diameter of the conic section that intersects the standard height of the listener

## Speaker Layout

## Floor

## Known:

Ceiling $=9^{\prime}$
Standing $5^{\prime} 6^{\prime \prime}=3^{\prime} 6^{\prime \prime}$ from ceiling ( $42^{\prime \prime}$ )
Sitting $3^{\prime} 6^{\prime \prime}=5^{\prime} 6^{\prime \prime}$ from ceiling ( $66^{\prime \prime}$ )
Assume dispersion angle is $120^{\circ}$

1. Calculate speaker coverage distance (conic section) at standing height, $D$
2. Divide dispersion angle by 2 to obtain a right triangle: $120^{\circ} / 2=60^{\circ}$
3. Using the properties of a right triangle we determine $1 / 2$ the coverage distance, $d$
a) Tangent $60^{\circ}=d / 42^{\prime \prime}$ and $d=$ Tangent $60^{\circ} \times 42^{\prime \prime}=72.75^{\prime \prime}=\operatorname{TAN}($ RADIANS(60)) * 42
b) $D=2 \times d=72.75 \times 2=145.5^{\prime \prime}$
c) $D=145.5^{\prime \prime} / 12^{\prime \prime}=12.1^{\prime}$
4. Similarly the calculation for seated height $\left(3^{\prime \prime} 6^{\prime \prime}\right)$ yields a conic section $=19^{\prime}$

## Speaker Layout

| No Overlap | Minimum Overlap | Maximum Overlap |
| :---: | :---: | :---: |
|  |  |  |
| $-4.4 \mathrm{~dB}$ <br> SPL Variation throughout sound field <br> Distance between speakers = Conic Section | $-2.0 \mathrm{~dB}$ <br> SPL Variation throughout sound field <br> Distance between speakers = $75 \%$ of Conic Section | $-1.4 \mathrm{~dB}$ <br> SPL Variation throughout sound field <br> Distance between speakers = $50 \%$ of Conic Section |

* SPL = Sound Pressure Level

## Speaker Placement

- $26^{\prime}$ x $20^{\prime}$ classroom
- Seated Listeners = 3'6" high
- Conic section = 19'
- Distance between Speakers = $50 \%$ of Conic section ( $9^{\prime} 6{ }^{\prime \prime}$ )

Provides maximum overlap for students who will be seated and move around
 the room in a technical lab atmosphere

# Grounding and Bonding of Shielded Cable 

UTP cable with crosstalk prevention technology

## Grounding and Bonding of Shielded Cable

- HDBaseT signals are similar to 10GBase-T
- $300-500 \mathrm{MHz}$ clock
- Alien crosstalk
- Headaches when there are adjacent rooms or multiple links

- Which cable?
- Shielded or UTP
- If shielded you must ground and bond
-Where do you ground and bond?
- Your option is the Telecommunications/Equipment Room

## Grounding and Bonding of Shielded Cable

- In point-to-point applications, it is often impractical to get to the TR
- More expensive cable and connectivity
- More labor intensive than UTP cable
- Perils of not bonding and grounding
- Safety
- High voltage crossed onto the shield
- Signal integrity
- Drain wire becomes an antenna

## Grounding and Bonding of Shielded Cable

- An alternative to shielded cable
- XTP or intermittent shielded cable with alien crosstalk prevention technology

Berk-Tek Leviton Technologies Connectivity Systems for AV

## AV6850

Cat 6A Premium 10G AV System

- Recommended for high speed and low-latency AV applications over 10GBASE-T infrastructure

## AV6400

Cat 6 Shielded 1G AV System

- Recommended for shielded AV applications over 1GBaseT infrastructure
